G01 review script

Proposed six-slide review; approximately 6-8 minutes. Not an execution report.

Slide 1: Purpose and status

Speaker: G01 is the discoverability gate, not the complete authorization gate. We are reviewing how the right operator reaches the existing console without exposing it to other users. The prior prototype mirrors #/console, while account-menu discovery is proposed. We will not call it deployed without matching runtime evidence.

Demonstration: Show route inventory and readiness labels.

Slide 2: Route and account context

Speaker: First trace the actual router and mounted screen. Then verify account-service configuration, sign-in and a trusted console:operate grant at the required platform scope. A browser flag, role label or repository owner identity cannot supply that authority.

Demonstration: Show code references and synthetic account matrix.

Slide 3: Discovery and workspace filters

Speaker: The menu entry is a convenience. Eligible operators see only workspaces permitted by capability, scope and enabled configuration. In the inspected prototype, Support additionally depends on supportTickets. We must verify current runtime behavior rather than assuming the prototype proves it.

Demonstration: Demonstrate eligible operator and disabled Support configuration.

Slide 4: Negative-path demonstration

Speaker: Now open the console route directly as signed-out, student, wrong-scope and revoked accounts. Each must be denied without protected data. Then test the permitted operator path. Missing navigation must not be fixed by removing policy checks.

Demonstration: Show allow/deny results; no production student data.

Slide 5: Backend and deployment handoff

Speaker: G01 proves the shell can be found. G02 separately proves server, database, file, search, export and AI authorization. G03 proves consequential actions. Finally compare the tested revision and flags with the deployed environment. A local build is not deployment evidence.

Demonstration: Show G02/G03 dependency and revision/configuration comparison.

Slide 6: Decision and next actions

Speaker: Accept G01 only with verified routing, scoped discovery, correct filters, direct-entry denial, accessible navigation and matching deployment evidence. Otherwise record the exact blocker, owner and next action. Do not authorize pilot launch solely because the console opens.

Demonstration: Record accept/blocked decision, reviewer, evidence and owner.
