Washington dataset update and test reconstruction

The prior ZIPs were unavailable in the current runtime. core.mjs and the original 12 assertions were reconstructed from the visible prior source; they were not extracted from the old archive. Eight calendar tests are new. This package is not a replacement full 21-university repository.

Run tests: `node --test tests/core.test.mjs` (Node 18+).

Apply addition to your previously downloaded standalone repository:
`python3 add_university.py /path/to/semester-credit-planner/universities.json`
For the Semester overlay target use `/path/to/semester/app/public/credit-planner/universities.json`.
This writes a backup and refuses duplicates. A 20-row file becomes 21 rows. Review changes on a feature branch; no remote changes performed.

Overlay inventory from previous generated source (not fresh archive inspection): index.html is page markup; app.js handles calculator/filter/sort and JSON fetch; core.mjs contains pure credit/degree arithmetic; style.css provides prototype styles; universities.json holds reference data. None is an authenticated Semester screen. No backend/database/official record writes.

calendar.mjs is tested standalone overlap logic. It is NOT wired into the previous browser UI. Comparisons need verified ISO dates, same interval meaning (instruction vs exams vs vacation), and explicit date conventions. Month ranges are not enough. Result counts inclusive calendar days, not class meeting days. Unknown dates must remain unknown.
