Slide deck design: transform Semester Native Business's 90-day roadmap into a structured PowerPoint presentation with OKRs and funnel metrics

Computer
Recruitment funnel scorecard: track sourcing, screening, interview scorecards, and offer conversion for Semester Native Business roles
Computer
Write the investor email template for Semester Native Business
Generate the interview scorecard CSV for the hiring pipeline
Build the G02 authorization checklist CSV and test suite

Created an editable 25-slide PowerPoint with the ninety-day roadmap, proposed OKRs, recruitment and fundraising funnels, and speaker notes. I also generated the interview-scorecard CSV, recruitment trackers, investor email template, G02 checklist CSV, and a two-layer authorization test package.

The PowerPoint was saved and reopened successfully. Generated Python test files passed syntax parsing, but authorization tests were not executed: OPA is unavailable here, and application tests require a real Semester staging adapter.

1. PowerPoint presentation

The presentation covers the proposed October 8, 2026–January 5, 2027 execution window.

Content	Included
Execution roadmap	Six phases with milestones, dependencies, and exit gates
OKRs	Governance, workflow reliability, pilot readiness, hiring, fundraising
Recruitment	Priorities, stages, interview loop, competency rubric
Funnel metrics	Sourcing, screening, interview, offer acceptance, investor conversion
Pilot readiness	Mandatory controls separated from outcome metrics
Authorization	Fourteen G02 checks and test-package limitations
Investor outreach	Draft email and approval requirements

Slides use editable text and shapes, a consistent hierarchy, and presenter notes. Proposed targets remain separate from actual results.

The design follows Semester's requirement to reuse canonical systems and distinguish designed, implemented, tested, deployed, institution-authorized, and production-enabled capabilities. [1]

2. Recruitment scorecard and funnel

The interview CSV contains 25 blank competency rows: five role templates with five competencies each. These are templates—not real candidates or approved openings.

Role templates

- Platform/backend.
- Implementation/operations.
- Trust/security reviewer.
- Product/frontend.
- Finance operations.

Proposed competency weights

Competency	Weight	Evidence sought
Domain execution	25%	Job-relevant delivery and verification
Security and data judgment	25%	Authority, minimization, least privilege
Failure and recovery	20%	Partial-failure handling and remediation
Ownership and documentation	15%	Decisions, evidence, accountable next actions
Collaboration	15%	Cross-functional coordination

Weights require approval for each role before use. Ratings use a proposed 1–4 scale, and every rating needs supporting evidence.

The CSV includes requisition ID, candidate ID, role, interview stage, interviewer, date, competency, weight, rating, evidence, safety concern, recommendation, follow-up, and decision owner.

A critical safety concern is a separate review gate. It cannot be averaged away by stronger scores elsewhere. Missing ratings mean incomplete assessment—not zero or pass.

Funnel tracking

The recruitment tracker records source channel, stage-entry/exit times, owner, next action, due date, outcome, budget reference, and scorecard reference.

Metrics include:

- Sourcing-to-screen conversion.
- Screen-to-interview conversion.

- Interview-to-offer conversion.
- Offer acceptance.
- Completed time in stage and active candidate age.

Use unique candidates from the same requisition and entry cohort. No conversion benchmarks or candidate counts were invented.

3. Investor email template

Subject: Semester | connecting the fragmented education experience

Hi [First name],

I'm building Semester, a unified education operating system designed to connect academic planning, learning, registration readiness, support, and institutional operations through one account and a governed platform.

I'm reaching out because [specific, verified connection to your investment thesis].

Our current focus is completing verified operator workflows and preparing an institution-authorized pilot. [Confirm or replace this sentence with an approved current-status statement before sending.]

[Optional: one substantiated milestone, with its date. Omit if none is available.]

We're [accurate fundraising status], with capital intended to support [approved milestone-based use of funds]. Would you be open to a 20-minute conversation about the product, execution plan, and fit with your thesis?

I can share an approved overview deck ahead of the conversation.

Best,
Harrison Rubin
Semester
[Verified contact details]

The separate template is editable. It has not been sent. Replace placeholders, verify the current-status sentence, and approve the exact recipient, content, and attachment before sending. Semester's specification prohibits unsupported customer, revenue, certification, outcome, and institutional-approval claims. [1]

4. G02 checklist and test suite

The checklist CSV contains fourteen authorization boundaries with accountable role, verification requirement, negative test, owner, reviewer, status, evidence reference, tested revision, environment, and next action.

All checks start as "Not assessed."

Test layers

Layer	Generated coverage	Execution status
PEP reference policy	31 vectors: baseline allow, denial guards, expiry boundary, missing inputs	Not run; compatible OPA runtime required
Application boundaries	24 paired allow/deny vectors across twelve boundaries	Not run; real staging adapter required
Audit and release	Safe audit evidence and runtime-revision checks	Generated scaffolds; adapter required

The PEP tests reproduce the conditions in the inspected v4 policy-enforcement reference: trusted context and grant verification, tenant/resource matching, allowed action, expiry, revocation freshness/generation, membership, policy/access revision, audit availability, and obligation support. [2]

Application cases cover identity, tenant, scope, consent, entitlement, API/RPC, database, storage, exports, AI retrieval, approval binding, and worker revocation.

Files in the test package

- PEP reference Rego policy.
- JSON test vectors.
- Python OPA test runner.
- Application authorization runner.
- Deliberately unimplemented adapter template.
- README with commands and response contracts.
- Generation-validation report.

Missing OPA or an application adapter causes a blocking error—not a passing skip. Application tests include paired positive controls so an adapter that denies everything cannot pass.

Run the reference tests in the extracted package:

```
python -m unittest test_pep_reference -v
```

After wiring a trusted staging adapter:

```
SEMESTER_GO2_ADAPTER=your_staging_adapter \
python -m unittest test_application_authorization -v
```

The adapter must execute actual synthetic-fixture workflows and inspect returned records, side effects, and evidence. It must not manufacture decisions from scenario names.

Limits and source issue

Passing the PEP reference tests would not prove RLS, file access, consent, entitlement, approval execution, export leakage prevention, or AI-provider enforcement. Those require application-level evidence.

The retrieved `policy_engine.rego` excerpt contains an anomalous standalone `PE policy` line. Verify the actual file and compile it before reuse; this may be an extraction artifact, and I have not established that the repository file is defective. The generated package does not copy or certify that PE file. [3]

The existing policy-test reference itself states that its tests had not been run there. This package therefore adds test artifacts without converting design evidence into a passing-runtime claim. [4]

5. Deliverables and activation

The generated files include:

- Editable PowerPoint.
- Interview-scorecard CSV.
- Recruitment funnel and metrics CSVs.
- Investor tracker and pilot checklist CSVs.
- Investor email template.
- G02 authorization checklist CSV.
- G02 test-suite ZIP.
- Combined hiring and authorization bundle.

Before activation, reconcile these artifacts with Semester's existing models and tests, assign named owners, wire the staging adapter, execute the suites, and attach reviewer evidence. No existing repository files were changed.

The project's release requirements still apply: canonical models, scoped server authorization, database protections, accessibility, monitoring, support, documentation, and release evidence. A generated deck or test scaffold does not establish launch readiness. [1]
