PowerPoint blueprint: 90-day roadmap deck for Semester Native Business — OKRs, funnel metrics, and phase-by-phase milestones structured for leadership review

Computer
Walk me through the G02 authorization checks
Review the slide deck's OKR alignment
Inspect the recruitment funnel scorecard template
Show the investor email draft and approval rules

The deck's overall direction is sound: the ninety-day plan connects governance, delivery, hiring, and fundraising. For leadership review, it needs clearer outcome measures, named decision owners, capacity assumptions, and a sharper separation between OKR progress and mandatory launch gates.

I'm reviewing the deck and scorecard content recorded in this conversation. The earlier generated PowerPoint and CSV were not available to reopen in this turn, so this is a content-level review—not a fresh inspection of their formatting or formulas. No current production authorization status is established.

1. Leadership deck and OKR alignment

Recommended presentation structure

Keep the main leadership discussion to twelve slides, with detailed G02 checks, interview rubrics, and test vectors in the appendix.

Slide	Leadership question	Required content
1. Decision brief	What must we decide today?	Scope, capacity, blockers, approvals requested
2. Evidence baseline	What is actually verified?	Designed/tested/deployed/authorized states; evidence date
3. Ninety-day objectives	What outcomes matter?	Five objectives, owners, proposed KRs
4. Roadmap	What happens when?	Six phases, dependencies, gates
5. Access and control	Can operators work safely?	G01–G03 status, test evidence, unresolved boundaries
6. Pilot readiness	What prevents activation?	Mandatory blockers, institution authority, rehearsal
7. Pilot outcomes	Does the workflow create value?	First value, completion, support burden, limitations

Slide	Leadership question	Required content
8. Recruitment	What capacity is missing?	Requisitions, affordability, coverage, funnel
9. Fundraising	What capital milestones are credible?	Approved materials, pipeline, diligence, cash assumptions
10. Operating metrics	What changed?	Cohort-based funnels, denominators, aging, data quality
11. Risks and scenarios	What can derail execution?	Material risks, mitigations, owners, stop triggers
12. Decisions and commitments	Who does what next?	Decision, owner, date, evidence, follow-up

Every metric should display its definition, period, denominator, source, freshness, and whether it is a target or actual. The project requires source-aware, auditable work and honest readiness labels rather than dashboard claims unsupported by evidence. [1]

OKR alignment review

Objective	Alignment	Improvement needed
O1: Governed execution	Directly supports G01/G02 and safe operation	Define the scoped P0 inventory before measuring “100%”; assign accountable owners and reviewers
O2: Reliable operations	Supports controlled actions and recovery	One complete workflow is a minimum proof point—not coverage of every consequential workflow
O3: Authorized pilot	Aligns with pilot gating	Add a useful-user-outcome measure; distinguish checklist disposition from actual mandatory passes
O4: Accountable capacity	Aligns with recruitment controls	Add coverage and onboarding outcomes, not just approved requisitions
O5: Fundraising readiness	Aligns with claims, financial preparation, and pipeline hygiene	Separate readiness from investor interest and received funding

Recommended revisions:

- O1: Record the complete approved P0 capability inventory by October 22; pass each applicable authorization gate before its capability is exposed.
- O2: Verify every consequential workflow enabled in the pilot, including denied, duplicate, stale-approval, and recovery paths.
- O3: Approve the first-value definition and baseline by December 6; report results and limitations at the final disposition review.
- O4: Establish named primary and backup coverage for every critical operating duty before activation; validate onboarding through a safely owned workflow.
- O5: Approve the investor package and track substantive investor progression separately from preparation activity.

A useful first-value target cannot be set credibly without the pilot cohort and baseline. Keep its numerical target pending until those are approved.

Roadmap corrections

The proposed dates remain:

Phase	Dates	Leadership gate
Audit and scope	Oct 8–22	Scope, canonical systems, owners, and blockers accepted
Access and capacity	Oct 23–Nov 6	Authorization evidence and coverage plan accepted
Controlled execution	Nov 7–21	Enabled workflows pass end-to-end and fault tests
Readiness rehearsal	Nov 22–Dec 6	Current readiness package and rehearsals accepted
Conditional pilot	Dec 7–21	Internal and institution authorization before activation
Hardening and disposition	Dec 22–Jan 5	Continue, expand, pause, or stop decision

Three planning gaps need resolution:

- Acquisition dependency: institution authorization is external to the engineering schedule. If no authorized sponsor/cohort exists, conduct synthetic rehearsal rather than implying a live pilot.
- Capacity dependency: hiring may not complete in time. Identify contractor/fractional capacity, delegation, and resequencing options without weakening gates.
- Calendar dependency: verify institutional registration, finals, holidays, and coverage windows before committing activation dates. The draft Engineering Playbook also restricts releases during pilot launch week, finals, and registration opening except critical fixes. [2]

2. G02 authorization walkthrough

G02 asks: “May this authenticated subject perform this action on this resource now?”

The answer must incorporate membership, capability, scope, relationship, policy, consent, classification, entitlement, and workflow state—not simply an operator role or visible menu. [1]

Fourteen checks

Check	What to inspect	Acceptance demonstration
A01: Identity/session	Trusted server identity, session validity, active account, step-up	Anonymous, expired, and forged context denied
A02: Membership/tenant	Active membership and authoritative resource tenant	Tenant-ID tampering and revoked membership denied
A03: Capability/scope	Action permission at platform/tenant/org/resource scope	Correct capability at the wrong scope denied
A04: Relationship/consent	Required resource relationship and current consent	Unrelated resource and revoked sharing denied
A05: Policy/classification/entitlement	Current policy, permitted data, module/entitlement state	Disallowed classification or inactive entitlement denied

Check	What to inspect	Acceptance demonstration
A06: API/RPC/command	Authorization on direct reads/writes and execution state	Hidden UI action cannot be invoked directly
A07: Database/RLS	Exposed tables/views and privileged functions	Other-tenant and company-to-student access denied
A08: Files/storage	Upload, preview, download, object scope, link lifetime	Cross-tenant access denied; link-expiry behavior verified
A09: Search/export/analytics	Results, metadata, counts, jobs, download scope	Hidden records do not leak through search or exports
A10: AI/tools/providers	Retrieval and tool authorization; provider data policy	Unauthorized retrieval and prohibited disclosure blocked
A11: Approvals	Exact request digest/version, approver authority, expiry	Changed payload, stale approval, prohibited self-approval rejected
A12: Revocation/workers	Current authority in sessions and background work	Revoked access cannot complete queued protected work
A13: Audit/errors	Safe decision evidence, correlation, failure behavior	No sensitive payload in errors/logs; required audit behavior enforced
A14: Release evidence	Repeatable tests, reviewer approval, runtime revision	Missing mandatory evidence blocks activation

The inspected PEP reference specifically checks verified context/grants, resource matching, allowed actions, expiry, fresh revocation, generation, active membership, policy/access revisions, audit availability, and obligation support. These are reference conditions, not proof of deployed enforcement.[3]

Trace one complete request

Use an operator export as the review example:

1. Resolve the operator’s identity from trusted server context.
2. Resolve the requested records and their real tenant scope.
3. Check capability, relationship, classification, policy, and entitlement.
4. Require step-up or approval when policy demands it.
5. Bind approval to the exact request and resource version.
6. Revalidate authority when the export worker starts.
7. Apply scope filters to every exported record.
8. Protect the generated artifact and reauthorize its download.
9. Record safe audit evidence and a receipt.
10. Revoke the grant and verify subsequent protected access stops.

Ask the reviewer to repeat the flow with a wrong tenant, expired grant, changed request, and revoked worker authority.

Evidence required to close G02

- Canonical implementation references.
- Positive controls proving permitted work succeeds.
- Negative tests proving protected work is denied.
- Inspection of returned records and side effects—not only status codes.
- Test environment and runtime revision.
- Reviewer and verification date.
- Explicit limitations and unresolved blockers.

The previous package contained 31 PEP vectors and application scaffolds. It did not establish passing OPA, RLS, storage, export, or AI tests. The source policy-test document likewise labels its reference tests as not yet run there. [4]

3. Recruitment scorecard inspection

The recorded template has a good foundation: candidate/requisition IDs, role, stage, interviewer, competency, weight, rating, evidence, safety concern, recommendation, follow-up, and decision owner.

Its five role templates and 25 competency rows are reusable assessment templates—not a candidate pipeline.

Template strengths and gaps

Area	Assessment	Required improvement
Identity and linkage	Candidate and requisition IDs are present	Add unique scorecard ID and rubric version
Competencies	Five useful competency groups	Define role-specific behavioral anchors
Weights	Proposed weights total 100%	Approve weights before interviewing; do not change them to favor a candidate
Evidence	Evidence field is present	Require concrete observations for every rating
Safety concerns	Separate concern field is present	Define review owner and resolution status
Recommendation	Supports assessor judgment	Separate individual recommendation from final hiring decision
Completion	Blank ratings remain visible	Add draft/submitted status and completion timestamp
Funnel analysis	Not sufficient in scorecard alone	Join to candidate stage-event history
Privacy	IDs reduce unnecessary detail	Keep personal information in restricted systems

Recommended additional fields:

```
scorecard_id
rubric_version
requisition_version
```

```
assessment_completed_at
submission_status
safety_review_status
debrief_decision_reference
```

The sourcing channel and candidate outcome belong primarily in the recruitment tracker, linked through IDs—not duplicated into every competency row.

Scoring rules

The proposed weights are:

Competency	Weight
Domain execution	25%
Security/data judgment	25%
Failure/recovery	20%
Ownership/documentation	15%
Collaboration	15%

Only compute a weighted score after all required ratings are complete:

$$\text{Weighted rating} = \frac{\sum_i w_i r_i}{\sum_i w_i}$$

Do not treat blank ratings as zero. Do not convert the average automatically into a hiring decision. A critical safety concern requires documented resolution.

Funnel rules

Track unique candidates by requisition and cohort:

- Screen conversion: entered screen ÷ sourced/applied.
- Interview conversion: entered loop ÷ screened.
- Offer conversion: offers issued ÷ completed loops.
- Offer acceptance: accepted ÷ issued offers.
- Start conversion: started ÷ accepted.

Report active aging separately from completed stage duration. Current-stage counts alone cannot reconstruct these conversions.

4. Investor draft and approval rules

Subject: Semester | connecting the fragmented education experience

Hi [First name],

I'm building Semester, a unified education operating system designed to connect academic planning, learning, registration readiness, support, and institutional operations through one account and a governed platform.

I'm reaching out because [specific, verified connection to your investment thesis].

Our current focus is completing verified operator workflows and preparing an institution-authorized pilot. [Confirm or replace this with an approved current-status statement.]

[Optional: one substantiated milestone, with its date. Omit if none is available.]

We're [accurate fundraising status], with capital intended to support [approved milestone-based use of funds]. Would you be open to a 20-minute conversation about the product, execution plan, and fit with your thesis?

I can share an approved overview deck ahead of the conversation.

Best,
Harrison Rubin
Semester
[Verified contact details]

Approval rules

Gate	Required review
Recipient	Resolve the actual person, firm, and email address
Fit	Verify the personalization; do not invent portfolio connections
Claims	Substantiate status, milestones, customers, revenue, approvals, and certifications
Financing	Confirm accurate fundraising status and approved use of capital
Materials	Approve the exact deck version and audience-appropriate access
Privacy	Exclude student records, candidate information, privileged advice, and unnecessary sensitive evidence
Sending	Obtain confirmation for the exact recipient, message, and attachments
Tracking	Record the actual send, version, owner, next action, and date

Semester's specification explicitly prohibits unsupported commercial and readiness claims. It also keeps consequential authority with approved human workflows. [1]

The draft remains unsent. The leadership decision should be to approve the narrative only after current status and financing language are verified—not to approve outreach with unresolved placeholders.
