outline expand and detail semedter intlgenes intervireer preper and practice for studetns and all the carreer systems and features

Semester Intelligence should power a connected **Career OS** that helps students discover possible paths, build credible evidence, find opportunities, prepare applications, practice interviews, evaluate offers, and transition into work or further study.

The central workflow should be:

Explore → build skills and evidence → discover opportunities → apply → prepare → practice → interview → follow up → decide → transition → reflect.

Interview preparation should be a deep native workspace inside that system—not an isolated chatbot or a question bank.

1. Starting point: extend what Semester already defines

Your design project already contains a student career screen with applications, interview preparation prompts, evidence artifacts, skills, portfolio export, alumni connections, and Career Center support. These are visible design components with example data, not proof of operational backend workflows. [1]

Your career implementation handoff also specifies skills, evidence portfolios, verified skills, opportunities, employer access to approved evidence only, institution feature switches, and tested access revocation. Its instruction is to audit and extend existing systems rather than create parallel implementations. [2]

The broader role specification connects students, career staff, alumni, and employers through skills evidence, opportunities, portfolios, mentoring, applications, and outcomes. It also requires role-aware authorization and policy-controlled AI. [3]

The expansion below is a proposed product and implementation specification. This answer does not verify live database coverage, deployed routes, passing tests, or institution-authorized activation.

2. Career OS system map

All career features should share Semester's account, Action Center, calendar, search, workspace, education graph, notifications, and AI gateway.

System	Student capabilities	Connected institutional capabilities
Career Home	Goals, active opportunities, preparation plans, next actions	Service availability, appointments, relevant events
Career Exploration	Compare occupations, industries, graduate study, research, entrepreneurship	Curated pathways and program-specific guidance
Skills and Evidence	Capture accomplishments, link artifacts, explain individual contributions	Authorized verification and competency frameworks
Portfolio	Build private and shareable collections	Scoped review, endorsement, credential provenance
Opportunity Discovery	Find internships, jobs, research, campus work, fellowships	Employer approval, posting review, recruiting programs
Application Studio	Résumés, cover letters, forms, supporting materials	Advisor review and approved templates
Application Tracker	Deadlines, stages, contacts, interviews, decisions	Student-permitted advising visibility
Interview Studio	Preparation, simulation, feedback, repetition	Coach appointments, reviewed question banks
Networking and Mentoring	Alumni discovery, introductions, informational interviews	Mentor enrollment, matching, safeguarding
Events and Recruiting	Career fairs, employer sessions, workshops	Scheduling, capacity, attendance, follow-up
Offer and Transition Workspace	Compare offers, plan questions, organize onboarding	Specialist referrals and transition support
Career Operations	Access support and manage requests	Caseloads, employer relations, service operations
Outcomes and Lifelong Career	Record outcomes voluntarily, maintain portable evidence	Governed reporting and alumni continuity

These are proposed capability groups, not claims that every module currently exists.

3. Semester Intelligence: interview preparation in depth

A. Interview Brief

Every interview should have a single preparation record containing:

- Opportunity and employer.
- Job description, source, and retrieval date.
- Interview stage and known format.
- Date, time zone, location or meeting link.
- Interviewer names and roles, when legitimately provided.
- Submitted résumé and application version.
- Required materials and logistical questions.

- Student-selected goals.
- Preparation tasks, practice sessions, and coach appointments.
- Known facts, assumptions, and missing information.

Unknown information must remain unknown. Semester should not invent interviewer preferences, employer scoring criteria, or “actual interview questions.”

B. Role and employer research

Semester Intelligence should produce a source-backed briefing:

1. What the organization does.
2. What the role asks the student to do.
3. Required versus preferred qualifications.
4. Relevant student experiences.
5. Areas to clarify with the recruiter.
6. Thoughtful questions to ask.
7. A source list with freshness and uncertainty.

A useful requirement-to-evidence view:

Role requirement	Student evidence	Current interpretation	Next action
Work with datasets	Course analysis project	Relevant artifact available	Practice explaining methods and limitations
Collaborate across a team	Student organization project	Student-reported experience	Clarify personal contribution
Use a specific tool	No linked evidence	Evidence gap, not proof of inability	Add a real example or prepare an honest learning plan

Company research, question preparation, logistics, and practice are consistent with university career-center interview guidance.[4] [5]

C. Personal story and accomplishment bank

Students should build reusable stories from:

- Coursework and capstones.
- Research and lab work.
- Employment and internships.
- Clubs and student leadership.
- Volunteering and community projects.
- Independent building and creative work.
- Other experiences the student chooses to include.

Each story should capture:

```
Title
Situation
Task or responsibility
Actions personally taken
Result
What was learned
Individual versus team contribution
Linked evidence
Relevant competencies
Permission and confidentiality limits
Student approval state
```

Support STAR—Situation, Task, Action, Result—as one answer structure, not a mandatory script. MIT's guidance emphasizes specific examples, the candidate's personal role, and preparing several stories before practicing with staff.[6]

Important product rules:

- Never invent achievements, metrics, credentials, or responsibilities.
- Distinguish "the team accomplished" from "I personally did."
- Help students describe incomplete or unsuccessful work honestly.
- Let students retain natural language rather than forcing corporate phrasing.
- Provide prompts when evidence is missing rather than filling gaps with fiction.

D. Personalized preparation plans

Generate an editable plan based on time remaining, format, role, student goals, and available capacity.

Preparation window	Suggested plan
Same day	Confirm logistics, review role, choose a few stories, run a short practice, prepare questions
Several days	Research, map evidence, rehearse introductions, complete focused practice, review gaps
One to two weeks	Add technical or case practice, book a coach, repeat weak areas, run a full simulation
No scheduled interview	Build story bank, explore formats, practice foundational answers, strengthen evidence

These are proposed planning templates, not universal prescriptions.

Connect preparation with academic workload. An interview task should compete transparently with coursework and other commitments—not silently override them or flood the student with reminders.

4. Interview Practice Studio

A. Practice modes

Mode	Experience
Quick practice	One question, one response, one focused improvement
Guided answer building	Student drafts an answer with structured prompts
Behavioral mock	Experience-based questions and relevant follow-ups
Recruiter screen	Motivation, background, role understanding, logistics
Technical interview	Coding, debugging, architecture, or discipline-specific reasoning
Case interview	Problem framing, assumptions, analysis, recommendation
Research interview	Methods, findings, uncertainty, ethics, individual contribution
Portfolio review	Walk through a selected artifact and defend decisions
Panel interview	Clearly labeled simulated interviewers with different perspectives
Recorded-response practice	Optional timed responses and retakes
Informational interview	Practice asking useful questions and explaining interests
Graduate or fellowship interview	Goals, research interests, program fit, experience
Human mock interview	Career coach, approved mentor, or peer session

University career centers already pair online practice with human mock interviews. Semester should preserve that combination rather than treat AI feedback as a replacement for coaching. [7] [8]

B. Interaction controls

Support:

- Text-only practice.
- Voice with an editable transcript.
- Optional video recording without automated appearance scoring.
- Adjustable timers.
- Pause, restart, skip, and “ask for clarification.”
- Captions and keyboard navigation.
- Low-bandwidth operation.
- Untimed and lower-pressure alternatives.
- Clear recording, retention, and deletion controls.

Simulation intensity should be student-controlled. “Realistic” must not mean humiliating, adversarial, or inaccessible.

C. Interviewer simulation

The simulator should:

1. Ask a role-relevant question.
2. Wait for the answer.
3. Ask a follow-up based on what the student actually said.
4. Probe reasoning, contribution, or missing context.
5. Avoid supplying the answer during a full mock unless requested.
6. End with a structured debrief.

Follow-up examples:

- “Which part did you personally own?”
- “What alternatives did you consider?”
- “How did you determine whether it worked?”
- “What would you change?”
- “What do you still not know?”

Every session must be labeled as simulated. Generated questions must not be represented as confirmed employer questions.

D. Feedback that students can act on

Use separate feedback dimensions rather than one opaque “hireability” score.

Dimension	Feedback question
Relevance	Did the answer address the question?
Specificity	Did it include a concrete example?
Contribution	Is the student’s personal role clear?
Reasoning	Are decisions and tradeoffs explained?
Evidence	Are claims grounded in real experience?
Structure	Can a listener follow the answer?
Completeness	Is a major part missing?
Reflection	Does the student explain learning or improvement?
Technical accuracy	Is the answer correct against an identified reference?

Each feedback item should include:

- A quotation or transcript segment.
- The observation.
- Why it matters.

- One suggested change.
- A focused retry.
- Uncertainty where the system lacks enough information.

Example:

> "Your answer describes the team's result, but your individual contribution is unclear. Add the specific analysis, implementation, or coordination you personally handled."

Do not infer personality, honesty, emotional state, disability, intelligence, or employability from facial expressions, gaze, accent, pitch, or speaking speed. EEOC-published material highlights accessibility, accommodations, clear assessment notices, and measuring necessary abilities directly rather than relying on correlated traits or scores. [9]

E. Deliberate practice loop

The core interaction should be:

Answer → inspect feedback → choose one improvement → retry → compare → save or discard.

Students should see what changed, not merely receive another generated answer.

Progress views should show:

- Question types practiced.
- Evidence used.
- Unresolved preparation gaps.
- Student-selected goals.
- Coaching observations.
- Changes across comparable sessions.

They should not claim to predict interview success or hiring probability.

5. Technical and discipline-specific practice

A general interview engine should support specialist practice packs.

Domain	Proposed capabilities
Software engineering	Coding, testing, debugging, system design, code review, project walkthrough
Data and analytics	SQL, interpretation, experiment design, data-quality checks, uncertainty
Engineering	Design constraints, calculations, safety reasoning, technical explanations
Business and consulting	Cases, market reasoning, operations, recommendations
Research and laboratory work	Methods, protocols, findings, reproducibility, limitations
Design and creative work	Portfolio critique, process, audience, iteration, accessibility
Education	Lesson planning, classroom scenarios, communication

Domain	Proposed capabilities
Public service and policy	Stakeholder analysis, policy tradeoffs, ethical scenarios
Health-related programs	Communication and program-approved scenarios, with qualified human oversight

For coding practice, use isolated execution with resource limits, restricted network access, and controlled file handling.

For discipline-specific evaluation:

- Publish the rubric and its owner.
- Identify the reference material.
- Version questions and answer guidance.
- Review generated questions before institutional publication.
- Let students challenge feedback.
- Route consequential or specialized judgments to qualified humans.

Do not expose restricted assessments or present generated questions as proprietary interview content.

6. The connected career systems

A. Career exploration and pathway planning

Students should be able to compare paths by:

- Work activities.
- Skills and qualifications.
- Education or credential requirements.
- Available experience-building options.
- Location and schedule preferences.
- Sourced compensation information, when available.
- Personal priorities and tradeoffs.

Connect exploration to academic planning without making a career recommendation an official degree requirement.

Use a versioned competency framework. NACE currently identifies eight career-readiness competencies and notes that Equity + Inclusion is under review, so Semester should retain framework versions rather than hardcode a permanently fixed definition. [10]

B. Skills, evidence, and portfolio

Separate these states:

- Student-claimed skill.
- AI-suggested association.
- Evidence-linked skill.
- Human-reviewed demonstration.
- Issuer-verified credential.

Linking a graded assignment does not automatically verify every skill associated with it. Verification must identify the authority, scope, date, and supporting evidence.

Portfolio capabilities should include:

- Private collections.
- Role-specific collections.
- Share previews.
- Expiring access.
- Revocation.
- Version history.
- Confidentiality redaction.
- Attribution and contributor roles.
- Downloadable exports.
- Clear disclosure of AI assistance where appropriate.

Your existing design already distinguishes a personal skill from linked graded evidence, and the career handoff limits employers to approved evidence. Preserve and deepen that boundary. [1] [2]

C. Application Studio

Provide:

- A reusable résumé fact bank.
- Multiple résumé versions.
- Role-specific cover-letter drafting.
- Short-answer and personal-statement workspaces.
- Evidence-backed accomplishment bullets.
- References and recommendation-request tracking.
- Submission checklists.
- Human review requests.

- Formatting and export checks.

Every generated claim should trace back to student-approved information.

Describe document feedback as completeness, relevance, readability, and formatting guidance—not guaranteed compatibility with every applicant-tracking system.

D. Opportunity discovery and matching

Cover:

- Internships and full-time roles.
- Campus employment.
- Research assistantships.
- Fellowships and scholarships.
- Apprenticeships.
- Approved experiential projects.
- Volunteer and leadership opportunities.
- Entrepreneurship programs.
- Graduate-study opportunities.

Matching should explain:

- Why the opportunity appeared.
- Which stated preferences it matches.
- Which eligibility requirements are confirmed.
- Which requirements are uncertain.
- Source and freshness.
- Any paid placement or sponsorship.

Keep eligibility checks separate from relevance ranking. Missing evidence is not the same as confirmed ineligibility.

E. Application and interview tracking

Suggested lifecycle:

```
Saved → Preparing → Submitted → Screening → Interviewing
→ Offer / Rejected / Withdrawn / Closed
```

Allow custom stages and separate student-entered updates from source-confirmed updates.

Each application should connect documents, contacts, deadlines, interviews, preparation, follow-ups, and decisions.

Email or calendar suggestions should require scoped authorization and correction controls. A calendar event does not prove attendance; an email interpretation does not prove an application outcome.

F. Networking, alumni, and mentoring

Provide:

- Opt-in mentor profiles.
- Availability and topic preferences.
- Explainable matching.
- Introduction requests.
- Informational-interview preparation.
- Shared agendas.
- Boundaries and reporting.
- Meeting reflections.
- Follow-up drafting.

Do not mine private conversations for employer-facing assessments.

G. Offers, negotiation, and transition

The decision workspace should compare:

- Compensation components.
- Benefits and costs.
- Location and relocation.
- Schedule and flexibility.
- Responsibilities.
- Learning and mentorship.
- Start dates.
- Acceptance deadlines.
- Student-defined priorities.
- Unknown contractual terms.

Semester can organize questions and practice negotiation conversations. It should not claim legal, tax, immigration, or financial authority.

After acceptance, support onboarding tasks, first-week questions, initial goals, internship reflections, and approved evidence capture.

7. Career staff, employer, alumni, and institutional workspaces

Career staff

- Appointment scheduling and queues.
- Student-permitted preparation context.
- Résumé and portfolio review.
- Mock interview rubrics.
- Referrals and follow-up.
- Workshops and question-bank management.
- Employer relations.
- Placement support.
- Service-quality monitoring.

Staff access should follow assigned responsibilities and student sharing permissions—not blanket access to private practice.

Employers

- Organization verification.
- Posting creation and institutional review.
- Recruiting-event participation.
- Student-approved portfolio access.
- Interview scheduling requests.
- Communication preferences.
- Access expiry and revocation.

Employer-facing AI candidate scoring should be outside the student-coaching system. Any future institutional hiring assessment would require a separate purpose, validation program, governance review, and activation decision.

Alumni and mentors

- Opt-in participation.
- Expertise and availability.
- Introduction requests.
- Mentoring sessions.
- Sharing controls.
- Reporting and withdrawal.

Institutional leaders

- Aggregate service utilization.
- Appointment access.
- Opportunity coverage.
- Voluntary outcome reporting.
- Data-quality and response-rate indicators.
- Employer engagement.
- Program-level trends with appropriate privacy controls.

Private recordings and transcripts should not become leadership analytics inputs by default.

8. Canonical architecture and AI boundaries

A. Proposed logical entities

These are conceptual entities to reconcile against the existing schema—not verified table names:

```
CareerGoal
CareerPreference
CompetencyFramework
SkillClaim
EvidenceArtifact
Verification
PortfolioCollection
ShareGrant
EmployerOrganization
Opportunity
Application
ApplicationDocumentVersion
Interview
PreparationPlan
Story
PracticeSession
PracticeResponse
FeedbackObservation
CoachReview
MentorProfile
MentoringRequest
Offer
CareerOutcome
```

Apply the relevant ownership, tenant scope, provenance, classification, retention, and access rules to each entity. Define explicit migration and consent handling when a self-serve user becomes institution-linked.

B. AI request flow

Use the existing governed AI architecture:

```
Authenticated user
→ tenant and role
→ resource authorization
→ purpose and consent
→ permitted sources
→ allowed model and tools
→ generated response
→ provenance and uncertainty
→ student review or human handoff
→ audit and evaluation
```

That architecture is already specified in the role-system materials. [3]

One policy issue needs resolution before implementation: the career stream says AI never receives student records, while the broader role specification describes policy-governed access to classified context. Start with explicitly selected student-owned preparation material; treat any access to institutional records as a separately approved policy decision, not implicit permission. [2] [3]

C. Bounded assistance

Semester Intelligence may propose:

- A preparation plan.
- A role briefing.
- Questions and practice sessions.
- Document revisions.
- Follow-up drafts.
- Scheduling options.
- Human coaching referrals.

It must obtain the required approval before sending communications, submitting applications, publishing portfolios, or changing external calendars.

An offer comparison is advice. Accepting or declining an offer is the student's decision.

9. Screen and workflow specification

Extend the existing Career screen as the entry point rather than adding a disconnected career application. [1]

Proposed screen	Primary action
Career Home	Choose the next career action

Proposed screen	Primary action
Path Explorer	Compare and save paths
Skills and Evidence	Link or review evidence
Portfolio Builder	Prepare a collection
Share Preview	Approve exactly what a recipient sees
Opportunities	Search, filter, and save
Opportunity Detail	Review fit and requirements
Application Studio	Prepare materials
Application Tracker	Update stage and next action
Interview Brief	Confirm context and logistics
Preparation Plan	Select tasks and schedule
Story Bank	Create or refine examples
Practice Setup	Choose format and controls
Practice Session	Answer and respond to follow-ups
Practice Review	Inspect feedback and retry
Coach Review	Request or view human feedback
Networking and Mentoring	Request a connection
Events and Recruiting	Register and prepare
Offer Comparison	Inspect tradeoffs
Transition Plan	Organize onboarding
Career Privacy	Manage sharing, recordings, retention
Career Staff Workspace	Operate support workflows

Every screen needs loading, empty, error, forbidden, and offline states, accessible navigation, and clear source/status distinctions. These requirements already appear in the career implementation handoff. [2]

10. Implementation sequence, owners, and gates

Sequencing should reduce dependency risk without narrowing the intended Career OS scope.

Work package	Accountable owner	Dependencies	Activation evidence
Existing-system audit	Engineering lead	Repository, schema, route and test access	Capability inventory with exact evidence
Career privacy and sharing	Security/privacy lead	Identity, storage, authorization	Access, expiry, revocation, and isolation tests

Work package	Accountable owner	Dependencies	Activation evidence
Evidence and application workflow	Career product lead	Existing portfolio and opportunity models	End-to-end save, edit, export, and tracking proof
Interview Brief and story bank	Student experience lead	Documents, tasks, provenance	Honest claim handling and recovery tests
Text practice and feedback	AI lead with career specialists	Policy gateway, rubrics, evaluation set	Feedback accuracy and safety evaluation
Voice and optional recording	Accessibility and engineering leads	Media storage, transcription, consent	Accessible alternatives and deletion proof
Technical practice	Engineering education lead	Isolated execution	Containment and reference-based scoring tests
Human coaching	Career services owner	Scheduling and sharing grants	Scoped review and staff workflow tests
Employer and alumni workflows	Institutional career owner	Verification, permissions, moderation	Tenant authorization and abuse handling
Outcome reporting	Institutional research owner	Consent, definitions, reporting controls	Privacy and denominator validation

Track each capability separately as:

Designed → implemented → tested → deployed → institution-authorized → production-enabled.

A design screen, migration file, or successful build is not evidence of all six states.

11. Acceptance criteria and evaluation

Student workflow

- A student can create an interview from an application.
- Known and unknown interview information remain distinguishable.
- Preparation tasks connect to the Action Center.
- A story can link to evidence without automatically becoming verified.
- Practice supports interruption and recovery.
- Feedback anchors observations to the actual response.
- The student can retry, compare, save, or discard.
- Sharing shows an exact preview.
- Revocation blocks subsequent recipient access.
- Recordings and transcripts follow declared retention and deletion behavior.

AI quality

- No fabricated accomplishments or employer facts.
- Unsupported claims are flagged or omitted.
- Role-specific questions match the supplied context.
- Technical judgments identify their reference basis.
- Feedback avoids personality and biometric inference.
- Insufficient context produces uncertainty, not confident scoring.
- Restricted institutional material is excluded unless explicitly authorized.
- Employer-facing candidate rankings are not derived from private practice.

Institutional readiness

- Tenant and role isolation tests pass.
- Storage authorization matches data authorization.
- Sensitive content stays out of general logs and analytics.
- Human review and support ownership are established.
- Accessibility evaluation is complete.
- Failure, rollback, and feature-disable procedures exist.
- Source synchronization and reconciliation are documented.
- Activation requires the appropriate institutional approval.

Product metrics

Measure:

- Preparation-plan completion.
- Practice-to-retry rate.
- Student-reported usefulness.
- Unsupported-feedback rate.
- Coach disagreement with AI feedback.
- Appointment access and wait times.
- Sharing and revocation reliability.
- Accessibility-related failures.
- Voluntary application and career outcomes, with response rates.

Keep preparation activity separate from employment outcomes. Usage alone does not establish that Semester caused an offer or placement.

12. The first end-to-end workflow to complete

The most useful first vertical slice is:

1. A student selects a saved opportunity.
2. Semester creates an Interview Brief from approved materials.
3. The student confirms logistics and chooses preparation goals.
4. Intelligence maps role requirements to real evidence.
5. The student selects or creates a few experience stories.
6. Semester proposes a manageable preparation plan.
7. The student completes a text-based mock with relevant follow-ups.
8. Feedback identifies one evidence-backed improvement at a time.
9. The student retries or requests a career coach.
10. After the interview, the student records a reflection and reviews a follow-up draft.

That slice connects the existing career design's applications, evidence, preparation prompt, and human support while producing the authorization, recovery, feedback-quality, and workflow evidence needed to expand responsibly. [1] [2]
